

Chart Selection Justification

Objective

The executive dashboard was designed to present business performance in a clear, interactive, and decision-focused manner. Each visualization was selected based on the business question it answers and follows data visualization best practices to improve readability and support executive decision-making.

1. Sales Trend View

Business Question

How are sales changing over time?

Chart Type

Line Chart

Why This Chart Is Appropriate

A line chart is the most suitable visualization for showing changes in sales over time because it clearly highlights trends, seasonality, and growth patterns.

Fields Used

- **X-Axis:** Order Date (Month/Year)
- **Y-Axis:** Sales
- **Color:** Sales Trend
- **Filter:** Date, Region

Design Principle Applied

- Chronological ordering
- Clear axis labels
- Minimal clutter
- Easy trend identification

Mistake Avoided

Avoided using a bar chart for time-series data, which would make long-term trends more difficult to interpret.

2. Regional Performance View

Business Question

Which regions perform best in terms of sales and profit?

Chart Type

Horizontal Bar Chart

Why This Chart Is Appropriate

A horizontal bar chart allows easy comparison of performance across regions and supports accurate ranking.

Fields Used

- **Rows:** Region
- **Columns:** Sales (or Profit)
- **Color:** Profit
- **Filter:** Category, Customer Segment

Design Principle Applied

- Ranked comparison
- Consistent color usage
- Easy label readability

Mistake Avoided

Avoided unnecessary 3D charts that distort value comparisons.

3. Category Profitability View

Business Question

Which product categories generate the highest profit?

Chart Type

Bar Chart

Why This Chart Is Appropriate

A bar chart clearly compares profit across categories and sub-categories while making it easy to identify top and bottom performers.

Fields Used

- **Category**
- **Sub-Category**
- **Profit**
- **Color:** Profit Margin

Design Principle Applied

- Sorted values
- Clear category labels
- Consistent color scale

Mistake Avoided

Avoided pie charts because category comparison requires accurate value comparison rather than percentage composition.

4. Customer Segment View

Business Question

How do customer segments differ in sales and profitability?

Chart Type

Clustered Bar Chart

Why This Chart Is Appropriate

The clustered bar chart enables direct comparison between customer segments across multiple business metrics.

Fields Used

- Customer Segment
- Sales
- Profit
- Color: Segment

Design Principle Applied

- Side-by-side comparison
- Consistent ordering
- Business-friendly labels

Mistake Avoided

Avoided stacked charts that make direct comparisons more difficult.

5. Shipping Performance View

Business Question

Which shipping modes experience delivery delays?

Chart Type

Bar Chart

Why This Chart Is Appropriate

A bar chart clearly compares average delivery delays across shipping methods.

Fields Used

- Ship Mode
- Average Delivery Days
- Shipping Delay Bucket
- Color: Delay Bucket

Design Principle Applied

- Clear comparisons
- Minimal visual clutter
- Consistent formatting

Mistake Avoided

Avoided unnecessary gauges or decorative visuals that provide limited analytical value.

6. Discount vs Profit View

Business Question

How does discount affect profitability?

Chart Type

Scatter Plot

Why This Chart Is Appropriate

A scatter plot is the best choice for examining the relationship between two numerical variables and identifying patterns or outliers.

Fields Used

- X-Axis: Discount
- Y-Axis: Profit
- Color: Category
- Size: Sales

Design Principle Applied

- Shows correlation clearly
- Highlights outliers
- Supports analytical exploration

Mistake Avoided

Avoided line charts because discount values are not sequential over time.

7. Return Analysis View

Business Question

Which categories or customer segments have the highest return rates?

Chart Type

Bar Chart

Why This Chart Is Appropriate

A bar chart provides a simple comparison of return rates across categories or customer segments.

Fields Used

- Category (or Customer Segment)
- Return Rate
- Color: Return Status

Design Principle Applied

- Clear ranking
- Easy comparison
- Readable labels

Mistake Avoided

Avoided pie charts because comparing multiple return rates is easier using bars.

Dashboard Design Principles

The dashboard follows several visualization best practices:

- Clear dashboard title
 - Consistent fonts and formatting
 - Meaningful color usage
 - Minimal clutter
 - Logical chart arrangement
 - KPI cards positioned at the top
 - Interactive filters for user exploration
 - Appropriate chart selection based on business questions
 - Consistent sorting and labeling
 - Focus on business interpretation rather than decorative visuals
-

Dashboard Filters

The dashboard includes interactive filters for:

- Region
- Category
- Customer Segment
- Order Date
- Ship Mode

These filters allow leadership to analyze business performance across different dimensions without creating multiple dashboards.

Dashboard Actions

Interactive dashboard actions enable users to click on one visualization and automatically filter related charts. This improves usability and supports detailed exploration of business performance.

Conclusion

The selected visualizations were chosen to answer specific business questions while following established data visualization principles. The combination of line charts, bar charts, and scatter plots provides leadership with an intuitive, interactive dashboard that supports effective monitoring of sales, profitability, customer behavior, shipping performance, discount impact, and return patterns. The dashboard emphasizes clarity, accuracy, and business decision-making while avoiding misleading or unnecessarily complex visualizations.
